7 DAYS / RS 2,000 / 500 UNIQUE REGISTRATIONS

Build trust before buying reach.

01 Who, why and the registration trigger

Target: final-year B.E./B.Tech students at 20 regional engineering colleges in Telangana and Andhra Pradesh; prioritize CSE/IT and AI-curious peers with basic computer skills, laptop access and no finished AI portfolio project. Geography is a planning choice, not a verified audience list.

Need: a small project they can build, personalize and explain in placement interviews. Proposed promise: a guided AI study-planner demo plus README outline in 60 minutes. Registration triggers: a credible project preview, clear prerequisites, a confirmed time and a trusted classmate or club invitation. No job, certificate or placement guarantees.

02 Three channels, in priority order

1 / Campus ambassadors + permitted WhatsApp groups

Recruit 20 active ambassadors from 30 prospective contacts. Each covers two non-overlapping final-year groups. Provide a project preview, tracked link and one approved reminder. Trust and relevance should reduce friction; access is not assumed.

2 / Student-to-student referrals

After registration, invite students to share with one suitable friend. Personal codes attribute new registrations. Sharing is optional; no reward per signup. The peer invitation gives useful context rather than a generic advertisement.

3 / Clubs + placement-cell email

Ask four approved clubs or placement cells to reach students outside the groups above. Use a clear project outcome and one tracked link. Count only incremental, deduplicated registrations.

03 The acquisition math: target 500, plan 520

Channel	Explicit base-case assumption	Regs
Campus	20 x 2 x 120 unique reach x 15% visits x 50%	360
Referrals	300 registrants x 40% share x 2 new visits x 50%	120
Clubs/email	400 incremental reach x 20% visits x 50%	40

Reach is unique after cross-group overlap; referrals and clubs are incremental. Attribute each email once to its first successful registration. These are testable assumptions, not industry benchmarks. A 20-registration buffer is only 4% of the goal.

EXECUTION / MEASUREMENT / JUDGMENT

A plan that can change course.

04 Seven days, with explicit checkpoints

Day 1 | 40 cumulative

Validate the offer with five students; confirm host, date/time, project and prerequisites. Approach 30 campus contacts; show a sample project before asking for distribution.

Day 2 | 100

Activate 20 ambassadors. Test outcome-first versus time-first copy in comparable approved groups. Track unique visits and valid registrations by source.

Day 3 | 180

If fewer than 12 ambassadors are active, use the 10-contact reserve. If visit-to-registration is below 35%, fix proof, timing clarity and form friction before expanding.

Days 4-5 | 280, then 370

Use the better-performing invitation directionally; trigger optional referrals and one permitted group reminder. Activate four clubs for incremental reach.

Days 6-7 | 440, then 500

At Day 6, quantify the gap. Ask approved backup clubs for the needed additional reach; do not assume recovery. Close registrations and send only consented reminders.

05 Budget discipline and failure cases

Rs 1,000: capped reimbursement pool, up to Rs 50 for each of 20 active ambassadors against actual eligible data/printing expenses. Rs 500: club logistics/printing only if needed and approved. Rs 500: contingency, released only for a measured bottleneck. Free tools and hosting assumed. No paid ads or cash-per-registration rewards. Max planned cost per target registration: Rs 4.

Conservative case: campus 4,800 x 10% x 45% = 216; referrals 200 x 30% x 2 x 60% = 72; clubs 400 x 20% x 40% = 32. Total: 320, a gap of 180. At 15% visit rate and 50% conversion, closing 180 needs 2,400 additional unique reach. That may exceed capacity: escalate early and report the miss honestly.

06 Working asset and measurement rules

Campus Relay prototype: registration + normalized-email deduplication, personal referral codes, source dashboard, CSV export, campaign-day guidance, invitation drafts and a sensitivity calculator. Seeded records are labelled samples. This is local browser storage, not a cross-device production database.

Success means 500 unique, eligible, consented registrations by Day 7; verify email before counting in a real launch. Separately monitor ambassador activation, unique visits, conversion, source mix and duplicate attempts. Attendance is downstream. The demo checks declared year, not real identity or email ownership.

Before execution: validate demand, audience access and workshop delivery. Publish confirmed logistics; add shared storage, email verification, protected admin access and data deletion. No real campaign or spend is claimed. All projected rates and costs above are planning inputs.
